About this project

Abstract This project is a Timetable Application developed for Mobile Devices. It differs from some of the other timetable applications currently available on the App Store and Google Play Store, because it has a common and a reliable security feature. This feature is the Google Two Factor Authentication. The user can disable or enable this feature at their own discretion. This Timetable Application also has a customisation feature which is the dark mode. This dark mode allows the user to switch between dark and light modes in the app. It changes the application theme colours from dark to light and vice versa. This feature will provide ease of use at any time of the day. Most importantly this mobile application will have easy to use Front-End interface. With a menu at the bottom of the screen with options to be picked from. In the application the user will have many screens to choose from. The Timetable screen, which displays the weekly schedule. The settings screen which offers settings in relation to the securities and the choice of theme within the application as well as account options. There is also the main menu screen which displays the information about the application and the author of the application. I have used React Native to develop this application and Firebase for the Back-End of this Timetable Application, which will store all of the user information, settings, and timetable data. The database merges whenever an internet connection is established with the device. The database that I have used is also real-time, which allows for instant display of data when it has been modified.

Authors Oskar Ciebien is a final year student at Atlantic Technological University (ATU) formerly known as Galway-Mayo Institute of Technology (GMIT). Currently pursuing a Bachelor of Science (Honours) in Computing in Software Development.

Chapter 1

Introduction

This is the introduction of the dissertation. Which outlines the layout of the dissertation, the objectives of the project and the scope.

1.1 Layout of the Dissertation

The following chapters will cover different aspects of the dissertation:

- **Chapter 1 - Introduction** - Chapter 1 which is the current chapter, will describe the project objectives, the aim of the project, briefly describe the project itself, the background and the scope.
- **Chapter 2 - Context** - Chapter 2 acts as an extension to the first chapter.
- **Chapter 3 - Methodology** - This chapter will discuss the approach on the project, the tools used while developing the project, source control, the types of testing and research done.
- **Chapter 4 - Technology Review** - Chapter 3 will provide a review on all the technologies and the languages that have been used.
- **Chapter 5 - System Design** - Will describe the project as a whole, the design and applications developed.
- **Chapter 6 - System Evaluation** - Will discuss the types of testing that have been carried out while developing the application.
- **Chapter 7 - Conclusion** - The final chapter will go over the evaluation, objectives, downfalls and the improvements that could have been done on the project.

Chapter 2

Context

2.1 Mobile Applications

Mobile Applications have a major impact on our productivity and lives. We use different applications in order to get our work done in a shorter length of time and to satisfy our needs accordingly [1]. We rely on our mobile devices every day as they are portable and we always carry them with us. These devices can have many use cases, and mobile applications only make it simpler and give us more functionality.

2.2 Mobile Devices

Mobile Phones already have some basic functionality which we also use sporadically such as a calculator, checking the weather or the calendar [1]. This is usually sufficient for users that use these devices for everyday use. Mobile applications allow us to take it a few steps further. Where we can control many things and not just use what is available on our device. For example when it comes to business management, we have applications that allow us to communicate with customers and staff, manage stock and finances etc.

2.3 How they make our life simpler

2.3.1 Time Saving and Convenient

There are many things that mobile applications offer us. One of which is time saving and convenience, instead of writing a shopping list, we can use our phone and therefore we save a bit of time as well as there is a smaller chance of us losing our phone than our list of groceries written on a piece of paper [1].

We can access certain applications much faster than logging onto a computer. This takes a considerable less amount of time as our mobile devices are always turned on and we do not have to wait for them to boot up. Something like accessing emails, saves us time and is super convenient as it only takes a few taps and we can do whatever we want. Either if it is reading the email, deleting, moving or even replying to it [1].

2.3.2 Entertaining and Fun

They offer us entertainment and fun. It is very easy to book a holiday, tickets for transport. They also offer us

2.3.3 Cheap

Most mobile applications are free to download and free to use. Unfortunately there are some that are paid, but there is a reason for that, they might offer a lot of useful functionality and features that we might need to carry out different tasks like photo editing.

Some applications offer

2.4 Filler

2.4.1 More filler

2.5 Filler

Chapter 3

Methodology

3.1 Overview

This methodology chapter will describe the various methodologies that have been used in developing this project. It goes over the Approach, Meetings the Source Control and the Tools that have also been used. Additionally it will go over some Research methods that were taken into account before making decisions.

3.2 Approach

3.3 Meetings

3.4 Source Control

3.5 Tools

Chapter 4

Technology Review

4.1 Overview

In this chapter, the different types of technologies that have been used while developing this project will be discussed with reasoning why they have been picked over the alternatives.

4.2 Technologies Used

4.2.1 Node

4.2.2 React Native

4.2.3 Firebase

4.2.4 Android Studio - Emulator

4.3 XML

Chapter 5

System Design

5.1 Overview

This chapter goes over the system design for the project. Since React Native allows for developing many applications with one code, this chapter will also go over the two types of applications this project was developed for.

5.2 Web Application

5.3 Android Application

Chapter 6

System Evaluation

6.1 Overview

This chapter will discuss the types of testings that were involved while developing the application. This way it will analyse various aspects of the project.

6.2 Graphical User Interface Testing

6.3 End to End Testing

6.4 Functional Testing

Chapter 7

Conclusion

7.1 Overview

This is the last chapter of this dissertation it will conclude all the other chapters. Discuss the objectives and analysis of the project and also mention any downfalls or problems encountered as well as the improvements that could be made in the future.

7.2 Context and Objectives

7.3 Evaluation

7.3.1 Improvements

7.3.2 Downfalls

7.3.3 Overall
